Kits for the most popular GSM phones
Software upgradable
International line interface (TBR 21)**

Product Description

Palladio is the digicom's GSM solution which is available in two different versions. The basic model PALLADIO allows the connection to the GSM network while the model PALLADIO TWIN can be used either on the GSM or the PSTN network.

Using Palladio Twin it is possible the connection to Internet/ Intranet up to the speed of 56000 bps on the telephone network and up to 9600 on the GSM network; also the fax transmission and reception on the GSM network is carried out successfully by using the proper telephones.

Palladio and Palladio Twin support the Radio Link Protocol for a secure transmission with no errors.

The range of the GSM phones supported by Palladio is getting wider and wider and consequently the hardware and software platform of digicom's boards is studied to change accordingly.

For this reason digicom supplies the kit for the desired telephone in a separate package containing the cable and the diskette with the drivers for the specific model of GSM phone.

Users of portable systems, like the GSM, often travel abroad and digicom implemented an integrated line interface which can be configured via software and allows to adapt Palladio Twin to the telephone networks of the specific country.

The packages of Palladio and Palladio Twin include all the software and the accessories needed for a correct installation and use. Internet subscription included.

Technical Features

- GSM PCMCIA board + 56000 Modem/Fax V.90 (Palladio Twin)
- GSM PCMCIA board (Palladio)
- 9600 and 14400 send-receive fax (Palladio Twin)
